ISSUE

A pre-release version (dated 3/3/94) of The NetWare Client for MS Windows NT is being distributed to users through Compuserve, FTP, and through US Mail. Versions exist for machines with Intel, MIPs, and DEC Alpha processors. To obtain the client, do one of the following:

Compuserve: From any CIS prompt, type "GO NOVFILES". This will take you to a menu-driven area. Select "Client Kits", then "Windows NT Versions". After reading the legal agreement, proceed to download the appropriate version for your CPU, NWNTI.EXE (for Intel), NWNTM.EXE (for Mips), or NWNTA.EXE (for Alpha). These files are not password protected, and are ready to be exploded.

Internet: FTP to NOVELL.COM. Navigate the directory to the \PUB\NETWIRE\NOVFILES\CLIENT.KIT\WINNT directory. There you will see 4 files:

REQUEST.TXT, NTINTEL.EXE, NTMIPS.EXE, and NTALPHA.EXE.

The NWNTx.EXE files are inside these files. They are password protected. The REQUEST.TXT file is an agreement which you can mail/email/fax in to receive the password needed to explode the file.

US Mail: Call (800) NETWARE. Then press 1, 5 and you will be connected with an agent who can arrange to have the file mailed to you via US Mail (Allow 2-4 weeks for delivery).

The readme file contains this statement regarding technical support:

Reporting Problems:

Novell supports only commercially available products through our technical support service. Please do not call Novell Technical Support with questions or problem reports about this software.

Feedback and support from other pre-release users is available on NOVDEV and NDSG forums. NOVDEV is section 17 (for registered developers) and NDSG is section 14.
